Results 1 - 11 of 11 [short listing](#)

- 1 [Readable computer documentation](#) 77%
 George R. Klare
ACM Journal of Computer Documentation (JCD) August 2000
Volume 24 Issue 3
A retrospective look shows earlier advice still relevant to both predicting and producing readable writing. For prediction, refined readability formulas with stronger criterion passages and updated familiar -word lists have appeared, although the computerization of readability tests sometimes encourages misapplying or misinterpreting them when screening text. For production, attention to sentence construction, word characteristics, and information density remains relevant to both drafting ...

- 5 The evaluation of text editors: a critical review of the Roberts and Morgan methodology based on new experiments 77%
 Nathaniel S. Borenstein
Proceedings of the SIGCHI conference on Human factors in computing systems April 1985
 Three text editors were studied using the editor evaluation methodology developed by Roberts and Moran [3, 4]. The results are presented as an extension of the studies by Roberts and Moran, with comparisons to the editors they studied earlier. In addition, supplementary measurements were taken that suggest minor flaws in the Roberts and Moran methodology. Further problems with the methodology are discussed, with an eye toward improving the methodology for future use. Although three signific ...
- 6 Charles Welty 77%
 **Proceedings of the ACM 12th annual computer science conference on SIGCSE symposium** January 1984
- 7 Author, publisher, and computer center 80%
 Robert C. Gruen
Proceedings of the 9th annual ACM SIGUCCS conference on User services October 1981
 Two developments in the writing and manufacturing of books are already bringing the university computer center into the text business and may, before long, create closer ties among authors, publishers, and computer centers. First, authors are using word processors and text editors to prepare their manuscripts, and they have a right to demand that their effort in getting the text correct should not be lost in rekeying when the manuscript is set into type. Publishers, on the other hand, are f ...
- 8 TEXTEDITing using APL/700 77%
 Harvey W. Bingham
Proceedings of the eighth international conference on APL September 1976
 TEXTEDIT is an APL application workspace for word processing that exploits the interactivity of Burroughs APL/700. Its purpose is to rapidly produce and maintain "typewriter-style" documentation of superior quality to normal manual typing. This is achieved by capturing draft text as typed, displaying it in finished format, accepting revisions easily, and filing draft or final text for subsequent updating or display. TEXTEDIT has been used for over four years by a variety of user ...
- 9 Natural language in document retrieval systems: Full text document retrieval: Hebrew legal texts (report on the first phase of the responsa retrieval project) 77%
 Y. Choueka , M. Cohen , J. Dueck , A. S. Fraenkel , M. Slac
Proceedings of the 1971 international ACM SIGIR conference on Information storage and retrieval April 1971
 A full text retrieval system was designed for the responsa literature, which is a large corpus of Hebrew legal cases. The unique problems of the data base --- mixture of Hebrew, Aramaic and vernaculars, lack of vowels and punctuation, extreme language inflection problems, homographs, existence of thousands of grammatical variants of any given keyword --- dictated development of new methods. Among them we list "grammatical synthesis", which synthesizes all grammatical variants of a given keyword; ...

10 A language independent macro processor

77%

William M. Waite

Communications of the ACM July 1967

Volume 10 Issue 7

The problem of obtaining starting values for the Newton-Raphson calculation of \sqrt{x} on a digital computer is considered. It is shown that the conventionally used best uniform approximations to \sqrt{x} do not provide optimal starting values. The problem of obtaining optimal starting values is stated, and several basic results are proved. A table of optimal polynomial starting values is given.

11 A technique for computer detection and correction of spelling errors

77%

Fred J. Damerau

Communications of the ACM March 1964

Volume 7 Issue 3

The method described assumes that a word which cannot be found in a dictionary has at most one error, which might be a wrong, missing or extra letter or a single transposition. The unidentified input word is compared to the dictionary again, testing each time to see if the words match—assuming one of these errors occurred. During a test run on garbled text, correct identifications were made for over 95 percent of these error types.
